

# ADvantage 8.4.0.2 Update Summary

---

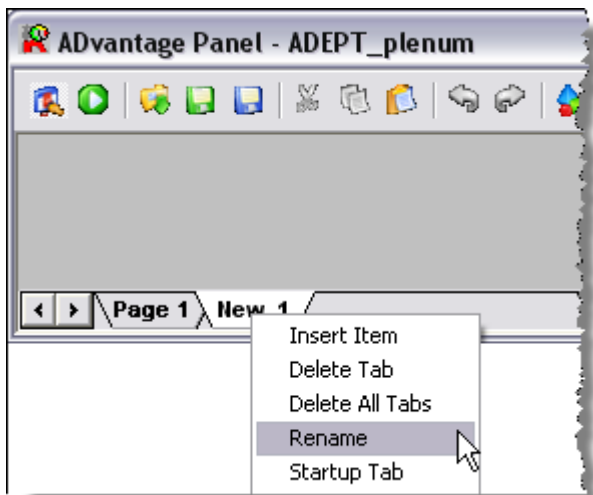

## 1 Minor Fixes / Enhancements

This update includes ~30 minor enhancements. Some noteworthy items are:

- A few logical device fixes were implemented to correct minor issues, including Brandywine IRIG-B, NI-6528, AIM-664, VMIC-5565, and HTV220 devices.
- A correction to the ADvantageVI hierarchical display of external dictionary and model referencing variables was made.
- Several documentation improvements were done, primarily for logical device and QNX tools version information.

## 2 Major Enhancements

One major enhancement has been included in this update. ADEPT panels now make use of tabs to allow for multiple “pages” within a single ADEPT file.

Since each ADEPT file appears in its own view window within ADvantageVI, this new feature provides for multiple panel pages to appear within the same window. It is also worth noting that most view windows in ADvantageVI (including ADEPT windows), can be Detached from main ADvantageVI application window, and that views within ADvantageVI can also be set to appear as tabs rather than separate windows. ADvantageVI has supported Detached and Tabbed views for some time.

## Devices / Drivers

Several new logical have been added, primarily to support new file formats generated from ADvantageDB. These include:

- New Goebel ARINC664 and P2P devices
- New Generic Serial and Reflective Memory (VMIC-5565) devices

- New UDP device
- New NAI 76CS1 resolver device
- New PCI versions of Ballard Arinc429 devices (421, 425)

Please refer to the release notes for detailed information.
