

# ADvantageSAS 1.0.2.2 Update Summary

---

This update includes several minor fixes and enhancements and one major enhancement.

## 1 Major Enhancements

This version now includes a License Server application that can be used for floating network license architectures. The following shows the user interface of the license server.

The license server may be setup to start on the host PC when the user logs in, with or without any visual interface. Log entries are written to a log text file on disk for diagnostic purposes.

Note that the license file contents will specify how it is to be used:

- Demo – local usage with no MAC validation
- Node Locked – local usage with MAC validation
- Client/Server – used by SasLicenseServer and SAS client applications

## 2 Minor Fixes / Enhancements

This update includes several bug fixes and minor enhancements, including:

- Chart Trace markers (if set) will be drawn automatically when a chart is paused – they are not drawn for performance reasons if the chart is dynamically displaying data.
- Some changes to the Simulink SIMplotter block for default DAS port setting to match SIMplotter and to correct an issue when saving DAS data to a CSV file.
- Some memory issues related to loading very large XDR files have been corrected.

- The included Python distribution has been updated to include required files to support the use of COM in Python scripts (Windows only).

Please refer to the release notes for detailed information.
